Legal Provisions

The information contained in these documents is the property of SMA Solar Technology AG. No part of this document may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, be it electronic, mechanical, photographic, magnetic or otherwise, without the prior written permission of SMA Solar Technology AG. Internal reproduction used solely for the purpose of product evaluation or other proper use is allowed and does not require prior approval.

SMA Solar Technology AG makes no representations or warranties, express or implied, with respect to this documentation or any of the equipment and/or software it may describe, including (with no limitation) any implied warranties of utility, merchantability, or fitness for any particular purpose. All such representations or warranties are expressly disclaimed. Neither SMA Solar Technology AG nor its distributors or dealers shall be liable for any indirect, incidental, or consequential damages under any circumstances.

The exclusion of implied warranties may not apply in all cases under some statutes, and thus the above exclusion may not apply.

Specifications are subject to change without notice. Every attempt has been made to make this document complete, accurate and up-to-date. Readers are cautioned, however, that product improvements and field usage experience may cause SMA Solar Technology AG to make changes to these specifications without advance notice or per contract provisions. SMA Solar Technology AG shall not be responsible for any damages, including indirect, incidental or consequential damages, caused by reliance on the material presented, including, but not limited to, omissions, typographical errors, arithmetical errors or listing errors in the content material.

SMA Warranty

You can download the current warranty conditions from the Internet at www.SMA-Solar.com.

Software licenses

The licenses for the installed software modules (open source) can be found in the user interface of the product.

Trademarks

All trademarks are recognized, even if not explicitly identified as such. Missing designations do not mean that a product or brand is not a registered trademark.

1 Information on this Document

1.1 Validity
This document is valid for:

- SB3.0-1AV-41 (Sunny Boy 3.0) from firmware version ≥ 3.00.00.R
- SB3.6-1AV-41 (Sunny Boy 3.6) from firmware version ≥ 3.00.00.R
- SB4.0-1AV-41 (Sunny Boy 4.0) from firmware version ≥ 3.00.00.R
- SB5.0-1AV-41 (Sunny Boy 5.0) from firmware version ≥ 3.00.00.R
- SB6.0-1AV-41 (Sunny Boy 6.0) from firmware version ≥ 3.00.00.R

1.2 Target Group
This document is intended for qualified persons and end users. Only qualified persons are allowed to perform the activities marked in this document with a warning symbol and the caption "Qualified person". Tasks that do not require any particular qualification are not marked and can also be performed by end users. Qualified persons must have the following skills:

- Knowledge of how an inverter works and is operated
- Training in how to deal with the dangers and risks associated with installing, repairing and using electrical devices and installations
- Training in the installation and commissioning of electrical devices and installations
- Knowledge of all applicable laws, standards and directives
- Knowledge of and compliance with this document and all safety information

1.3 Content and Structure of this Document
This document describes the mounting, installation, commissioning, configuration, operation, troubleshooting and decommissioning of the product as well as the operation of the product user interface.

You will find the latest version of this document and further information on the product in PDF format and as eManual at www.SMA-Solar.com. You can also call up the eManual via the user interface of the product.

Illustrations in this document are reduced to the essential information and may deviate from the real product.

1.4 Levels of Warning Messages
The following levels of warning messages may occur when handling the product.

2 Safety

2.1 Intended Use

The Sunny Boy is a transformerless PV inverter with two MPP trackers which converts the direct current of the PV array to grid-compliant alternating current and feeds it into the utility grid. The product is suitable for indoor and outdoor use.

The product must only be operated with PV modules of protection class II in accordance with IEC 61730, application class A. The PV modules must be compatible with this product.

The product is not equipped with an integrated transformer and therefore has no galvanic isolation. The product must not be operated with PV modules whose outputs are grounded. This can cause the product to be destroyed. The product may be operated with PV modules whose frame is grounded.

PV modules with a high capacity to ground must only be used if their coupling capacity does not exceed 1.4 μF (for information on how to determine the coupling capacity, see the Technical Information "Leading Leakage Currents" at www.SMA-Solar.com).

All components must remain within their permitted operating ranges and their installation requirements at all times.

The product must only be used in countries for which it is approved or released by SMA Solar Technology AG and the grid operator.

Use SMA products only in accordance with the information provided in the enclosed documentation and with the locally applicable laws, regulations, standards and directives. Any other application may cause personal injury or property damage.

Alterations to the SMA products, e.g., changes or modifications, are only permitted with the express written permission of SMA Solar Technology AG. Unauthorized alterations will void guarantee and warranty claims and in most cases terminate the operating license. SMA Solar Technology AG shall not be held liable for any damage caused by such changes.

Any use of the product other than that described in the Intended Use section does not qualify as the intended use.

The enclosed documentation is an integral part of this product. Keep the documentation in a convenient, dry place for future reference and observe all instructions contained therein.

This document does not replace and is not intended to replace any local, state, provincial, federal or national laws, regulations or codes applicable to the installation, electrical safety and use of the product. SMA Solar Technology AG assumes no responsibility for the compliance or non-compliance with such laws or codes in connection with the installation of the product.

The type label must remain permanently attached to the product.

2.2 IMPORTANT SAFETY INSTRUCTIONS

SAVE THESE INSTRUCTIONS
This section contains safety information that must be observed at all times when working. The product has been designed and tested in accordance with international safety requirements. As with all electrical or electronical devices, there are residual risks despite careful construction. To prevent personal injury and property damage and to ensure long-term operation of the product, read this section carefully and observe all safety information at all times.

⚠️ **DANGER**

**Danger to life due to electric shock when live components or DC cables are touched**

When exposed to light, the PV modules generate high DC voltage which is present in the DC cables. Touching live DC cables results in death or lethal injuries due to electric shock.

- Do not touch non-insulated parts or cables.
- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Wear suitable personal protective equipment for all work on the product.

⚠️ **DANGER**

**Danger to life due to electric shock when live components are touched on opening the product**

High voltages are present in the live parts and cables inside the product during operation. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Do not open the product.

⚠️ **DANGER**

**Danger to life due to electric shock from touching an ungrounded PV module or array frame**

Touching ungrounded PV modules or array frames results in death or lethal injuries due to electric shock.

- Connect and ground the frame of the PV modules, the array frame and the electrically conductive surfaces so that there is continuous conduction. Observe the applicable local regulations.
**DANGER**

**Danger to life due to electric shock when touching live system components in case of a ground fault**

If a ground fault occurs, parts of the system may still be live. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Touch the cables of the PV array on the insulation only.
- Do not touch any parts of the substructure or frame of the PV array.
- Do not connect PV strings with ground faults to the inverter.

**WARNING**

**Danger to life due to fire or explosion**

In rare cases, an explosive gas mixture can be generated inside the product under fault conditions. In this state, switching operations can cause a fire inside the product or explosion. Death or lethal injuries due to hot or flying debris can result.

- In the event of a fault, do not perform any direct actions on the product.
- Ensure that unauthorized persons have no access to the product.
- Do not operate the DC load-break switch on the inverter in the event of ground fault
- Disconnect the PV array from the inverter via an external disconnection device. If there is no disconnecting device present, wait until no more DC power is applied to the inverter.
- Disconnect the AC circuit breaker, or keep it disconnected in case it has already tripped, and secure it against reconnection.
- Only perform work on the product (e.g., troubleshooting, repair work) when wearing personal protective equipment for handling of hazardous substances (e.g., safety gloves, eye and face protection, respiratory protection).
WARNING
Risk of injury due to toxic substances, gases and dusts.
In rare cases, damages to electronic components can result in the formation of toxic substances, gases or dusts inside the product. Touching toxic substances and inhaling toxic gases and dusts can cause skin irritation, burns or poisoning, trouble breathing and nausea.
- Only perform work on the product (e.g., troubleshooting, repair work) when wearing personal protective equipment for handling of hazardous substances (e.g., safety gloves, eye and face protection, respiratory protection).
- Ensure that unauthorized persons have no access to the product.

WARNING
Danger to life due to electric shock from destruction of the measuring device due to overvoltage
Overvoltage can damage a measuring device and result in voltage being present in the enclosure of the measuring device. Touching the live enclosure of the measuring device results in death or lethal injuries due to electric shock.
- Only use measuring devices with a DC input voltage range of 600 V or higher.

CAUTION
Risk of burns due to hot enclosure parts
Some parts of the enclosure can get hot during operation. Touching hot enclosure parts can result in burn injuries.
- During operation, do not touch any parts other than the enclosure lid of the inverter.

CAUTION
Risk of injury due to weight of product
Injuries may result if the product is lifted incorrectly or dropped while being transported or mounted.
- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.

NOTICE
High costs due to inappropriate Internet tariff
Depending on use, the data volume of the product transferred via the Internet may vary in size. The data volume depends, for example, on the number of inverters in the system, the frequency of device updates, the frequency of data transfer to Sunny Portal or the use of FTP push. High costs for the Internet connection can be the result.
- SMA Solar Technology AG recommends using an Internet flat rate.
### NOTICE

**Damage to the product due to cleaning agents**
The use of cleaning agents may cause damage to the product and its components.
- Clean the product and all its components only with a cloth moistened with clear water.

**Change to the names and units of grid parameters to comply with the grid-connection requirements in accordance with Regulation (EU) 2016/631 (valid from April 27, 2019)**

To comply with the EU grid-connection requirements (valid from April 27, 2019) the names and units of grid parameters were changed. This change is valid from firmware version ≥ 3.00.00.R if a country data set for fulfilling the EU grid-connection requirements (valid from 2019-04-27) is set. Names and units of grid parameters for inverters with firmware version ≤ 2.99.99.R are not affected by this change and remain valid. This also applies from firmware version ≥ 3.00.00.R if a country data set that is valid for countries outside the EU is set.
3 Scope of Delivery

Check the scope of delivery for completeness and any externally visible damage. Contact your distributor if the scope of delivery is incomplete or damaged.

### 4.2 Symbols on the Product

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| ![Warning](warning.png) | Beware of a danger zone  
This symbol indicates that the product must be additionally grounded if additional grounding or equipotential bonding is required at the installation site. |
| ![Warning](warning.png) | Beware of electrical voltage  
The product operates at high voltages. |
| ![Warning](warning.png) | Beware of hot surface  
The product can get hot during operation. |
| ![Warning](warning.png) | Danger to life due to high voltages in the inverter; observe a waiting time of 5 minutes  
High voltages that can cause lethal electric shocks are present in the live components of the inverter.  
Prior to performing any work on the inverter, disconnect it from all voltage sources as described in this document. |
| ![Information](info.png) | Observe the documentation  
Observe all documentation supplied with the product. |
| ![Information](info.png) | Observe the documentation  
Together with the red LED, this symbol indicates an error. |
| ![Inverter](inverter.png) | Inverter  
Together with the green LED, this symbol indicates the operating state of the inverter. |
| ![Network](network.png) | Data transmission  
Together with the blue LED, this symbol indicates the status of the network connection. |
| ![Grounding](grounding.png) | Grounding conductor  
This symbol indicates the position for connecting a grounding conductor. |
| ![AC](ac.png) | Alternating current |
| ![DC](dc.png) | Direct current |
4.3 Interfaces and Functions

The product is equipped with the following interfaces and functions:

- **Symbol**
  - Explanation: The product has no galvanic isolation.

- **Symbol**
  - Explanation: WEEE designation
  - Do not dispose of the product together with the household waste but in accordance with the disposal regulations for electronic waste applicable at the installation site.

- **Symbol**
  - Explanation: The product is suitable for outdoor installation.

- **Symbol**
  - Explanation: Degree of protection IP65
  - The product is protected against the penetration of dust and water that is directed as a jet against the enclosure from all directions.

- **Symbol**
  - Explanation: CE marking
  - The product complies with the requirements of the applicable EU directives.

- **Symbol**
  - Explanation: RoHS labeling
  - The product complies with the requirements of the applicable EU directives.

- **Symbol**
  - Explanation: RCM (Regulatory Compliance Mark)
  - The product complies with the requirements of the applicable Australian standards.

- **Symbol**
  - Explanation: ICASA
  - The product complies with the requirements of the South African standards for telecommunication.

- **Symbol**
  - Explanation: ANATEL
  - The product complies with the requirements of the Brazilian standards for telecommunication.
  - Este equipamento opera em caráter secundário, isto é, não tem direito a proteção contra interferência prejudicial, mesmo de estações do mesmo tipo, e não pode causar interferência a sistemas operando em caráter primário.

- **Symbol**
  - Explanation: The product complies with the Moroccan safety and EMC requirements for electronic products.
User interface for monitoring and configuration

The product is equipped as standard with an integrated webserver, which provides a user interface for configuring and monitoring the product. The product user interface can be called up via the web browser if there is an existing connection to an end device (e.g. computer, tablet PC or smartphone).

Smart Inverter Screen

The Smart Inverter Screen enables you to view the status display and to display the current power and consumption on the user interface login page. This gives you an overview of the most important inverter data without having to log into the user interface.

The Smart Inverter Screen is deactivated by default. The Smart Inverter Screen can be activated via the user interface once the inverter has been commissioned.

SMA Speedwire

The product is equipped with SMA Speedwire as standard. SMA Speedwire is a type of communication based on the Ethernet standard. SMA Speedwire is designed for a data transfer rate of 100 Mbps and enables optimum communication between Speedwire devices within systems.

The product supports the encrypted system communication with SMA Speedwire Encrypted Communication. In order to be able to use the Speedwire encryption in the system, all Speedwire devices, except for the SMA Energy Meter, must support the function SMA Speedwire Encrypted Communication.

SMA Webconnect

The product is equipped with a Webconnect function as standard. The Webconnect function enables direct data transmission between the product and Internet portals Sunny Portal and Sunny Places without any additional communication device and for a maximum of 4 products per visualized system. In PV systems with more than 4 products, there is the option of establishing data transmission between the products and Sunny Portal via the data logger (e.g., SMA Data Manager) or distributing the inverters over several systems. If there is an existing WLAN or Ethernet connection, you can directly access your visualized system via the web browser on your end device.

Webconnect enables - for PV systems operated in Italy - the connection or disconnection of the inverter to or from the utility grid and the specifying of the frequency limits to be used via IEC61850-GOOSE messages.

WLAN connection to SMA 360° app

The product has a QR code. By scanning the QR Code attached to the product via the SMA 360° app, access to the product is established via WLAN and the connection to the user interface is made automatically.
WLAN
The product is equipped with a WLAN interface as standard. The inverter is delivered with the WLAN interface activated as standard. If you do not want to use WLAN, you can deactivate the WLAN interface.
In addition, the product has a WPS function. The WPS function is for automatically connecting the product to a network (e.g. via router) and establish a direct connection between the product and an end device.

Modbus
The product is equipped with a Modbus interface. The Modbus interface is deactivated by default and must be configured as needed.
The Modbus interface of the supported SMA products is designed for industrial use – via SCADA systems, for example – and has the following tasks:
• Remote query of measured values
• Remote setting of operating parameters
• Setpoint specifications for system control

RS485 Interface
The inverter is equipped with an RS485 interface as standard. The inverter can communicate via cables with SMA communication products or with up to three gateways for the TS4 module technology via the RS485 interface (information on supported SMA products at www.SMA-Solar.com).

Integration of TS4-R module technology
The inverter is equipped with an RS485 interface and the Cloud Connect function as standard to integrate the TS4 module technology. Up to three gateways in line topology can be connected to the inverter via the RS485 interface. The use of a separate Cloud Connect Advanced communication unit is not required. The Cloud Connect function has the following functions:
• Easy integration of the TS4 module technology components into the system
• Easy commissioning and configuration via the user interface of the inverter
• Visualization and monitoring via Sunny Portal

Grid management services
The product is equipped with service functions for grid management.
Depending on the requirements of the grid operator, you can activate and configure the functions (e.g. active power limitation) via operating parameters.

Parallel Operation of the DC Inputs A and B
You have the option of operating the inverter DC inputs A and B in parallel. As a result, and as opposed to normal operation, several parallel-connected strings can be connected to the inverter. The inverter automatically detects the parallel operation of the DC inputs A and B.
SMA ShadeFix
The inverter is equipped with the shade management system SMA ShadeFix. SMA ShadeFix uses an intelligent MPP tracking system to determine the operating point with the highest output during shading conditions. With SMA ShadeFix, inverters use the best possible energy supply from the PV modules at all times to increase yields in shaded systems. SMA ShadeFix is enabled by default. The time interval of SMA ShadeFix is usually six minutes. This means that the inverter determines the optimum operating point every six minutes. Depending on the PV system or shading situation, it may be useful to adjust the time interval.

All-pole sensitive residual-current monitoring unit
The all-pole sensitive residual-current monitoring unit detects alternating and direct differential currents. In single-phase and three-phase inverters, the integrated differential current sensor detects the current difference between the neutral conductor and the line conductor(s). If the current difference increases suddenly, the inverter disconnects from the utility grid.

SMA Smart Connected
SMA Smart Connected is the free monitoring of the product via the SMA Sunny Portal. Thanks to SMA Smart Connected, the operator and qualified person will be informed automatically and proactively about product events that occur.
SMA Smart Connected is activated during registration in Sunny Portal. In order to use SMA Smart Connected, it is necessary that the product is permanently connected to Sunny Portal and the data of the operator and qualified person is stored in Sunny Portal and up-to-date.

4.4 LED Signals
The LEDs indicate the operating state of the product.

5 Mounting

5.1 Requirements for Mounting

Requirements for the Mounting Location:

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Danger to life due to fire or explosion</strong></td>
</tr>
<tr>
<td>Despite careful construction, electrical devices can cause fires. This can result in death or serious injury.</td>
</tr>
<tr>
<td>• Do not mount the product in areas containing highly flammable materials or gases.</td>
</tr>
<tr>
<td>• Do not mount the product in potentially explosive atmospheres.</td>
</tr>
</tbody>
</table>

☐ A solid support surface must be available (e.g., concrete or masonry). When mounted on drywall or similar materials, the product emits audible vibrations during operation which could be perceived as annoying.

☐ The mounting location must be inaccessible to children.

☐ The mounting location must be suitable for the weight and dimensions of the product (see Section 13 "Technical Data", page 100).

☐ The mounting location must not be exposed to direct solar irradiation. If the product is exposed to direct solar irradiation, the exterior plastic parts might age prematurely and overheating might occur. When becoming too hot, the product reduces its power output to avoid overheating.

☐ The mounting location should be freely and safely accessible at all times without the need for any auxiliary equipment (such as scaffolding or lifting platforms). Non-fulfillment of these criteria may restrict servicing.

☐ The DC load-break switch of the product must always be freely accessible.

☐ All ambient conditions must be met (see Section 13, page 100).

☐ To ensure optimum operation, the ambient temperature should be between -25°C and +40°C.

**Permitted and prohibited mounting positions:**

☐ The product may only be mounted in a permitted position. This will ensure that no moisture can penetrate the product.

☐ The product should be mounted such that the LED signals can be read off without difficulty.

![Figure 5: Permitted and prohibited mounting positions](image-url)
Dimensions for mounting:

Figure 6: Position of the anchoring points (Dimensions in mm)

Recommended clearances:

If you maintain the recommended clearances, adequate heat dissipation will be ensured. Thus, you will prevent power reduction due to excessive temperature.

☐ Maintain the recommended clearances to walls as well as to other inverters or objects.
☐ If multiple inverters are mounted in areas with high ambient temperatures, increase the clearances between the inverters and ensure sufficient fresh-air supply.
5.2 Mounting the Inverter

**QUALIFIED PERSON**

Additionally required mounting material (not included in the scope of delivery):

☐ 3 screws, suitable for the support surface and the weight of the inverter (diameter: minimum 6 mm)

☐ 3 washers, suitable for the screws (outer diameter: minimum 18 mm)

☐ Where necessary, three screw anchors suitable for the support surface and the screws

**CAUTION**

**Risk of injury due to weight of product**

Injuries may result if the product is lifted incorrectly or dropped while being transported or mounted.

• Transport and lift the product carefully. Take the weight of the product into account.

• Wear suitable personal protective equipment for all work on the product.

**Procedure:**

1. **CAUTION**

**Risk of injury due to damaged cables**

There may be power cables or other supply lines (e.g., gas or water) routed in the wall.

• Ensure that no lines are laid in the wall which could be damaged when drilling holes.
2. Align the wall mounting bracket horizontally on the wall and mark the position of the drill holes. Use at least one hole on the right- and left-hand side and the lower hole in the middle of the wall mounting bracket. Tip: When mounting on a post, use the upper and lower central holes of the wall mounting bracket.

3. Set the wall mounting bracket aside and drill the marked holes.
4. Insert screw anchors into the drill holes if the support surface requires them.
5. Secure the wall mounting bracket horizontally using screws and washers.

6. Hook the inverter into the wall mounting bracket. When doing so, the two right- and left-hand keys on the ribs on the rear side of the inverter must be hooked into the respective keyways in the wall mounting bracket.

7. Ensure that the inverter is securely in place.
8. Secure the inverter to the wall mounting bracket. To do so, insert one pan head screw M5x12 each into the lower screw hole on both sides of the inverter anchorage bracket respectively and tighten them using a Torx screwdriver (TX 25, torque: 2.5 Nm).
6 Electrical Connection

</table>

6.2 AC Connection

6.2.1 Requirements for the AC Connection

AC cable requirements as follows:

- Conductor type: copper wire
- External diameter: 8 mm to 21 mm
- Conductor cross-section: 1.5 mm² to 6 mm²
- Insulation stripping length: 12 mm
- Sheath stripping length: 50 mm
- The cable must be dimensioned in accordance with the local and national directives for the dimensioning of cables. The requirements for the minimum wire size derive from these directives. Examples of factors influencing cable dimensioning are: nominal AC current, type of cable, routing method, cable bundling, ambient temperature and maximum desired line losses (for calculation of line losses, see the design software "Sunny Design" from software version 2.0 at www.SMA-Solar.com).
Grounding cable requirements:

**i Use of fine-stranded conductors**

You can use an inflexible or a flexible, fine-stranded conductor.

- When using a fine-stranded conductor, it has to be double crimped by a ring terminal lug. Make sure that no insulated conductor is visible when pulling or bending. This will ensure sufficient strain relief by means of the ring terminal lug.

☐ Grounding cable cross-section: max. 10 mm²

Load-break switch and cable protection:

**NOTICE**

**Damage to the inverter due to the use of screw-type fuses as load-break switches**

Screw-type fuses (e.g. DIAZED fuse or NEOZED fuse) are not load-break switches.

- Do not use screw-type fuses as load-break switches.
- Use a load-break switch or circuit breaker as a load disconnection unit (for information and design examples, see the Technical Information "Circuit Breaker" at www.SMA-Solar.com).

☐ In PV systems with multiple inverters, protect each inverter with a separate circuit breaker. Make sure to observe the maximum permissible fuse protection (see Section 13 "Technical Data", page 100). This will prevent residual voltage from being present at the corresponding cable after disconnection.

☐ Loads installed between the inverter and the circuit breaker must be fused separately.

Residual-current monitoring unit:

The inverter does not require an external residual-current device when operating. If local regulations require the use of a residual-current device, the following must be observed:

☐ The inverter with firmware version 3.00.10.R is compatible with type A/B residual-current devices that have a rated residual current of 30 mA or higher (information about the selection of a residual-current device see technical information "Criteria for Selecting a Residual-Current Device" at www.SMA-Solar.com). Each inverter in the system must be connected to the utility grid via a separate residual-current device.

☐ When using residual-current devices with a rated residual current of 30 mA, the rated residual current must be set in the inverter (see Section 8.17, page 67). In this way the inverter reduces the operational leakage currents and prevents a false triggering of the residual-current device.

Overvoltage category:

The inverter can be used in grids of overvoltage category III or lower in accordance with IEC 60664-1. That means that the inverter can be permanently connected to the grid-connection point of a building. In case of installations with long outdoor cabling routes, additional measures to reduce overvoltage category IV to overvoltage category III are required (see the Technical Information "Overvoltage Protection" at www.SMA-Solar.com).
**Grounding conductor monitoring:**
The inverter is equipped with a grounding conductor monitoring device. This grounding conductor monitoring device detects when there is no grounding conductor connected and disconnects the inverter from the utility grid if this is the case. Depending on the installation site and grid configuration, it may be advisable to disable the grounding conductor monitoring. This can be necessary, for example, in a Delta IT system or other grid configurations if there is no neutral conductor present and you intend to install the inverter between two line conductors. If you are uncertain about this, contact your grid operator or SMA Solar Technology AG.

- Grounding conductor monitoring must be disabled after initial start-up depending on the grid configuration (see Section 8.15, page 67).

**Safety in accordance with IEC 62109 when the grounding conductor monitoring is deactivated**
In order to guarantee safety in accordance with IEC 62109 when the grounding conductor monitoring is deactivated, you have to connect an additional grounding conductor to the inverter.

- Connect an additional grounding conductor that has an cross-section of at least 10 mm (see Section 6.2.3, page 32). This prevents touch current in the event of the grounding conductor on the AC connector bush insert failing.

**Connection of an additional grounding conductor**
In some countries, an additional grounding conductor is generally required. In each case, observe the locally applicable regulations.

- If an additional grounding conductor is required, connect the one that has an cross-section of at least 10 mm (see Section 6.2.3, page 32). This prevents touch current in the event of the grounding conductor on the AC connector bush insert failing.

### 6.2.2 Connecting the Inverter to the Utility Grid

**QUALIFIED PERSON**

**Requirements:**
- The connection requirements of the grid operator must be met.
- The grid voltage must be within the permissible range. The exact operating range of the inverter is specified in the operating parameters.

**Procedure:**
1. Disconnect the circuit breaker and secure it against reconnection.
2. Dismantle the AC cable by 50 mm.
3. Shorten L and N by 8 mm each, so that the grounding conductor is 8 mm longer. This ensures that the grounding conductor is the last to be pulled from the screw terminal in the event of tensile strain.
4. Strip the insulation of L, N and the grounding conductor 12 mm.
5. In the case of fine stranded wire L, N and PE are to be fitted with bootlace ferrules.
6. Assemble the AC connector and connect the conductor to the AC connector (see manual of the AC connector).

7. Ensure that all conductors are securely connected to the AC connector.

8. Plug the AC connector into the jack for the AC connection. When doing so, align the AC connector so that the key on the inverter AC jack is inserted into the keyway on the AC connector bush insert.

### 6.2.3 Connecting Additional Grounding

**⚠️ QUALIFIED PERSON**

If additional grounding or equipotential bonding is required locally, you can connect additional grounding to the inverter. This prevents touch current if the grounding conductor on the AC connector fails. The necessary ring terminal lug and the screw are included in the scope of delivery of the inverter.

**Additionaly required material (not included in the scope of delivery):**

- 1 grounding cable

**Grounding cable requirements:**

#### Use of fine-stranded conductors

You can use an inflexible or a flexible, fine-stranded conductor.

- When using a fine-stranded conductor, it has to be double crimped by a ring terminal lug. Make sure that no insulated conductor is visible when pulling or bending. This will ensure sufficient strain relief by means of the ring terminal lug.

- Grounding cable cross-section: max. 10 mm²

**Procedure:**

1. Strip the grounding cable insulation.

2. Insert the stripped part of the grounding cable into the ring terminal lug and crimp using a crimping tool.
3. Insert the pan head screw M5x12 into the screw hole in the ring terminal lug and screw the ring terminal lug with screw firmly onto the connection point for additional grounding using a Torx screwdriver (TX 25, torque: 2.5 Nm).

6.3 Connecting the Network Cables

⚠️ QUALIFIED PERSON

⚠️ DANGER

Danger to life due to electric shock in case of overvoltages and if surge protection is missing

Overvoltages (e. g. in the event of a flash of lightning) can be further conducted into the building and to other connected devices in the same network via the network cables or other data cables if there is no surge protection. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Ensure that all devices in the same network are integrated in the existing overvoltage protection.
- When laying the network cable outdoors, ensure that there is suitable surge protection at the network cable transition from the product outdoors to the network inside the building.

⚠️ NOTICE

Damage to the inverter due to moisture ingress

Moisture penetration can damage the inverter and impair its functionality.

- Connect the network cable with the supplied RJ45 protective sleeve to the inverter.

Additionally required material (not included in the scope of delivery):

☐ 1 network cable
Network cable requirements:
The cable length and quality affect the quality of the signal. Observe the following cable requirements.

- Cable type: 100BaseTx
- Cable category: minimum CAT5e
- Plug type: RJ45 of Cat5, Cat5e or higher
- Shielding: SF/UTP, S/UTP, SF/FTP or S/FTP
- Number of insulated conductor pairs and insulated conductor cross-section: at least 2 x 2 x 0.22 mm²
- Maximum cable length between two nodes when using patch cables: 50 m (164 ft)
- Maximum cable length between two nodes when using installation cables: 100 m (328 ft)
- UV-resistant for outdoor use.

Procedure:

1. **DANGER**

   Danger to life due to electric shock
   - Disconnect the inverter from all voltage sources (see Section 9, page 70).

2. Unscrew the protective cap from the network port.

3. Press the cable support sleeve out of the threaded sleeve.

4. Thread the swivel nut and threaded sleeve over the network cable. At the same time, thread the network cable through the opening in the cable support sleeve.

5. Press the cable support sleeve into the threaded sleeve.

6. Plug the network cable connector into the network port on the inverter and screw the threaded sleeve onto the network port thread on the inverter.
7. Screw the swivel nut onto the threaded sleeve.

8. If you would like to establish a direct connection, connect the other end of the network cable directly to the end device.

9. If you would like to integrate the inverter into a local network, connect the other end of the network cable to the local network (e.g., via a router).

6.4 Connecting RS485 Devices

⚠️ QUALIFIED PERSON

Additionally required material (not included in the scope of delivery):

- One communication cable for RS485 communication
- One M12 plug, 4-pole

Signal assignment:

<table>
<thead>
<tr>
<th>Pin connector</th>
<th>Signal</th>

<td>2</td>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>

Procedure:

1. **DANGER**

   Danger to life due to electric shock
   - Disconnect the inverter from all voltage sources (see Section 9, page 70).

2. Assemble the M12 plug and connect the RS485 cable to the plug (see manual of the M12 connector).

3. Ensure that all conductors are correctly connected to the M12 plug.

4. Unscrew the protective cap from the jack for the RS485 communication connection.
5. Plug the M12 connector into the jack for the RS485 communication connection and screw tight. When doing so, align the connector so that the key on the inverter AC jack is inserted into the keyway on the plug.

### 6.5 Mounting the WLAN Antenna

**⚠️ QUALIFIED PERSON**

**Requirement:**
- The WLAN antenna supplied must be used.

**Procedure:**

1. **⚠️ DANGER**
   - **Danger to life due to electric shock**
     - Disconnect the inverter from all voltage sources (see Section 9, page 70).

2. Remove the protective cap from the jack on the inverter.
3. Plug the WLAN antenna into the jack and screw tight (torque: 1 Nm).
4. Pull on the WLAN antenna to ensure that the WLAN antenna is securely in place.

### 6.6 DC Connection

#### 6.6.1 Requirements for the DC Connection

**Connection options:**
The inverter has two DC inputs, to each of which one string can be connected in normal operation.
You have the option of operating the DC inputs A and B in parallel, and therefore of connecting several strings to the inverter.

Figure 9: Connection overview for normal operation

Figure 10: Connection overview for parallel connection of the DC inputs A and B
Requirements for the PV modules per input:
☐ All PV modules should be of the same type.
☐ All PV modules should be aligned and tilted identically.
☐ On the coldest day based on statistical records, the open-circuit voltage of the PV array must never exceed the maximum input voltage of the inverter.
☐ The same number of series-connected PV modules must be connected to each string.
☐ The maximum input current per string must be maintained and must not exceed the through-fault current of the DC connectors (see Section 13 "Technical Data", page 100).
☐ The thresholds for the input voltage and the input current of the inverter must be adhered to (see Section 13 "Technical Data", page 100).
☐ The positive connection cables of the PV modules must be equipped with positive DC connectors (see Section 6.6.2, page 38).
☐ The negative connection cables of the PV modules must be equipped with the negative DC connectors (see Section 6.6.2, page 38).

Use of Y adapters for parallel connection of strings
The Y adapters must not be used to interrupt the DC circuit.
- Do not use the Y adapters in the immediate vicinity of the inverter. The adapters must not be visible or freely accessible.
- In order to interrupt the DC circuit, always disconnect the inverter as described in this document (see Section 9, page 70).

6.6.2 Assembling the DC Connectors

⚠️ QUALIFIED PERSON

DANGER

Danger to life due to electric shock when live components or DC cables are touched
When exposed to light, the PV modules generate high DC voltage which is present in the DC cables. Touching live DC cables results in death or lethal injuries due to electric shock.
- Do not touch non-insulated parts or cables.
- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Wear suitable personal protective equipment for all work on the product.

NOTICE

Destruction of the inverter due to overvoltage
If the open-circuit voltage of the PV modules exceeds the maximum input voltage of the inverter, the inverter can be destroyed due to overvoltage.
- If the open-circuit voltage of the PV modules exceeds the maximum input voltage of the inverter, do not connect any strings to the inverter and check the design of the PV system.
For connection to the inverter, all PV module connection cables must be fitted with the DC connectors provided. Assemble the DC connectors as described in the following. The procedure is identical for both connectors (+ and -). The graphics for the procedure are shown for only the positive connector as an example. Pay attention to the correct polarity when assembling the DC connectors. The DC connectors are marked with the symbols "+" and "-".

Cable requirements:
- Cable type: PV1-F, UL-ZKLA, USE2
- External diameter: 5 mm to 8 mm
- Conductor cross-section: 2.5 mm² to 6 mm²
- Qty single wires: minimum 7
- Nominal voltage: minimum 1000 V
- Using bootlace ferrules is not allowed.

Procedure:
1. Strip 12 mm of the cable insulation.
2. Insert the stripped cable into the DC connector up to the stop. When doing so, ensure that the stripped cable and the DC connector are of the same polarity.
3. Press the clamping bracket down until it audibly snaps into place.
The stranded wire can be seen inside the clamping bracket chamber.

4. If the stranded wire is not visible in the chamber, the cable is not correctly inserted and the connector must be reassembled. To do this, the cable must be removed from the connector.
   - Release the clamping bracket. To do so, insert a screwdriver (blade width: 3.5 mm) into the clamping bracket and pry the clamping bracket open.
   - Remove the cable and go back to step 2.

5. Push the swivel nut up to the thread and tighten (torque: 2 Nm).

6.6.3 Connecting the PV Array

**NOTICE**

**QUALIFIED PERSON**

**NOTICE**

**Destruction of the inverter due to overvoltage**

If the open-circuit voltage of the PV modules exceeds the maximum input voltage of the inverter, the inverter can be destroyed due to overvoltage.

- If the open-circuit voltage of the PV modules exceeds the maximum input voltage of the inverter, do not connect any strings to the inverter and check the design of the PV system.
**WARNING**

**Danger to life due to electric shock from destruction of the measuring device due to overvoltage**

Overvoltage can damage a measuring device and result in voltage being present in the enclosure of the measuring device. Touching the live enclosure of the measuring device results in death or lethal injuries due to electric shock.

- Only use measuring devices with a DC input voltage range of 600 V or higher.

---

**NOTICE**

**Damage to the DC connectors due to the use of contact cleaner of other cleaning agents**

Some contact cleaners or other cleaning agents may contain substances that decompose the plastic of the DC connectors.

- Do not use contact cleaners or other cleaning agents for cleaning the DC connectors.

---

**NOTICE**

**Damage to the inverter due to ground fault on DC side during operation**

Due to the transformerless topology of the product, the occurrence of ground faults on DC side during operation can lead to irreparable damage. Damages to the product due to a faulty or damaged DC installation are not covered by warranty. The product is equipped with a protective device that checks whether a ground fault is present during the starting sequence. The product is not protected during operation.

- Ensure that the DC installation is carried out correctly and no ground fault occurs during operation.

---

**Procedure:**

1. Ensure that the circuit breaker is switched off and that it cannot be reconnected.
2. If an external DC load-break switch is installed, disconnect the external DC load-break switch from all voltage sources.
3. Set the DC load-break switch of the inverter to position **O**.
4. Measure the PV array voltage. Ensure that the maximum input voltage of the inverter is adhered to and that there is no ground fault in the PV array.
5. Check whether the DC connectors have the correct polarity.
   If the DC connector is equipped with a DC cable of the wrong polarity, the DC connector must be reassembled. The DC cable must always have the same polarity as the DC connector.
6. Ensure that the open-circuit voltage of the PV array does not exceed the maximum input voltage of the inverter.
7. Connect the assembled DC connectors to the inverter.

☑ The DC connectors snap into place.
8. Ensure that all DC connectors are securely in place.

9. **NOTICE**
   
   **Damage to the product due to sand, dust and moisture ingress if the DC inputs are not closed**
   
   The product is only properly sealed when all unused DC inputs are closed with DC connectors and sealing plugs. Sand, dust and moisture penetration can damage the product and impair its functionality.
   
   - Seal all unused DC inputs using the DC connectors and sealing plugs as described in the following. When doing so, do not plug the sealing plugs directly into the DC inputs on the inverter.

10. For unused DC connectors, push down the clamping bracket and push the swivel nut up to the thread.
11. Insert the sealing plug into the DC connector.

12. Insert the DC connectors with sealing plugs into the corresponding DC inputs on the inverter.
    ☑ The DC connectors snap into place.
13. Ensure that the DC connectors with sealing plugs are securely in place.

6.6.4 **Disassembling the DC Connectors**

⚠️ **QUALIFIED PERSON**

To disassemble the DC connectors (e.g. due to faulty assembly), proceed as follows.
**DANGER**

**Danger to life due to electric shock when touching exposed DC conductors or DC plug contacts if the DC connectors are damaged or loose**

The DC connectors can break or become damaged, become free of the DC cables, or no longer be connected correctly if the DC connectors are released and disconnected incorrectly. This can result in the DC conductors or DC plug contacts being exposed. Touching live DC conductors or DC plug connectors will result in death or serious injury due to electric shock.

- Wear insulated gloves and use insulated tools when working on the DC connectors.
- Ensure that the DC connectors are in perfect condition and that none of the DC conductors or DC plug contacts are exposed.
- Carefully release and remove the DC connectors as described in the following.

**Procedure:**

1. Release and remove the DC connectors. To do so, insert a flat-blade screwdriver or an angled screwdriver (blade width: 3.5 mm) into one of the side slots and pull the DC connectors out. When doing so, do not lever the DC connectors out, but insert the tool into one of the side slots only to release the locking mechanism, and do not pull on the cable.

2. Remove the DC connector swivel nut.

3. Unlock the DC connector. To do this, insert a flat-blade screwdriver (blade width: 3.5 mm) into the side catch mechanism and pry the catch mechanism open.

4. Carefully pull the DC connector apart.
5. Release the clamping bracket. To do so, insert a flat-blade screwdriver (blade width: 3.5 mm) into the clamping bracket and pry the clamping bracket open.

6. Remove the cable.
7 Commissioning

7.1 Commissioning Procedure

⚠️ QUALIFIED PERSON

Commissioning a product in SMA Energy Systems
If the product is used in an SMA Energy System, the commissioning must be performed according to the manual of the SMA Energy System. The procedure and the sequence may differ from the steps described in this section.

- Commissioning an SMA Energy System (see system manual of the SMA Energy System).

Commissioning an inverter that is captured in a communication device
When the inverter is captured in a communication device, the communication device (e.g. SMA Data Manager) is the unit for configuring the total system. The configuration is transferred to all inverters in the system. The system password assigned via the communication device is also the password for the user interface of the inverter.

- Commission the inverter (see Section 7.2, page 46).
- The initial configuration of the inverter is made via the communication device. The configuration is transferred to the inverter and the settings of the inverter are overwritten.
- Deactivate the Webconnect function of the inverter via the Sunny Portal. This prevents unnecessary connection attempts of the inverter with Sunny Portal.

This section describes the commissioning procedure and gives an overview of the steps you must perform in the prescribed order.

### 7 Commissioning

#### 7.2 Commissioning the Inverter

**QUALIFIED PERSON**

**Requirements:**
- ☐ The AC circuit breaker must be correctly rated and mounted.
- ☐ The inverter must be correctly mounted.
- ☐ All cables must be correctly connected.

**Procedure:**

1. Switch on the AC circuit breaker.
2. Turn the DC load-break switch of the inverter to position I.

☐ All three LEDs light up. The start-up phase begins.
☐ During start-up phase of the inverter, the desired firmware is being installed.
☐ All three LEDs go out again after approximately 90 seconds.
☐ The green LED starts to flash and, if the inverter is connected via Speedwire, the blue LED also starts to flash. If the green LED is still flashing after some time, the conditions for activating feed-in operation are not yet met. As soon as the conditions for feed-in operation are met, the inverter starts with feed-in operation and, depending on the available power, the green LED will light up continuously or it will pulse.

3. If the red LED is glowing, an error has occurred that must be rectified (see Section 11, page 74).

### 7.3 Selecting a configuration option

**⚠️ QUALIFIED PERSON**

After having assigned the password to the **Installer** or **User**, the *Configuring the Inverter* page opens.

![Diagram of the Configuring the Inverter page](image)

#### Position | Designation | Description
---|---|---
A | Device information | Provides the following information:
|  | • Device name  
|  | • Inverter serial number  
|  | • Inverter firmware version
B | User information | Provides brief information on the listed configuration options
C | Skip configuration | Offers the option of skipping the inverter configuration and go directly to the user interface (not recommended)
D | Checkbox | Allows you to choose not to have the displayed page displayed again when the user interface is called up again
E | Configuration options | Provides a selection of the various configuration options

**Configuration options:**

On the *Configuring the Inverter* page, different configuration options are available to choose from. Select one of the options and proceed for the selected option as described below. SMA Solar Technology AG recommends carrying out the configuration with the installation assistant. This way, you ensure that all relevant parameters are set for optimal inverter operation.
Accepting the settings

Saving the made settings is indicated by an hourglass symbol on the user interface. If the DC voltage is sufficient, the data is transferred directly to the inverter and accepted. If the DC voltage is too low (e.g. in the evening), the settings are saved, but they cannot be directly transferred to or accepted by the inverter. As long as the inverter has not yet received and accepted the settings, the hourglass symbol will continue to be displayed on the user interface. The settings will be accepted when there is sufficient DC voltage applied and the inverter restarts. As soon as the hourglass symbol appears on the user interface, the settings have been saved. The settings will not be lost. You can log off of the user interface and leave the system.

Adopting the Configuration from a File

You can adopt the inverter configuration from a file. To do this, there must be an inverter configuration saved to a file.

Procedure:
1. Select the configuration option **Adopting configuration from a file**.
2. Select [Browse...] and select the desired file.
3. Select [Import file].

Configuring the Installation Assistant (Recommended)

Procedure:
1. Select the configuration option **Configuration with Installation Assistant**.
   - ☑ The installation assistant will open.
2. Follow the installation assistant steps and make the settings appropriate for your system.
3. For every setting made in a step, select [Save and next].
   - ☑ In the last step, all made settings are listed in a summary.
4. To correct settings you made, select [Back], navigate to the desired step, correct settings and select [Save and continue].
5. Once all settings are correct, select [Next] in the summary.
6. To save the settings to a file, select [Export a summary] and save the file on your end device.
7. To export all parameters and their settings, select [Export all parameters]. This exports all parameters and their settings into an HTML file.
   - ☑ The start page of the user interface opens.

Manual configuration

You can configure the inverter manually by setting the desired parameters.
Procedure:

1. Select the configuration option **Manual Configuration**.
   - The **Device Parameters** menu on the user interface will open and all available parameter groups of the inverter will be displayed.
2. Select [**Edit parameters**].
3. Select the desired parameter group.
   - All available parameters of the parameter group will be displayed.
4. Set the desired parameters.
5. Select [**Save all**].
   - The inverter parameters are set.

7.4  Starting the Self-Test (for Italy and Dubai)

⚠️ QUALIFIED PERSON

The self-test is only required for inverters that are to be commissioned in Italy or Dubai. The Italian standard CEI 0-21 and the DEWA (Dubai Electricity and Water Authority) stipulate that all inverters that feed into the utility grid are equipped with a self-test function. During the self-test, the inverter will consecutively check the reaction times for overvoltage, undervoltage, maximum frequency and minimum frequency.

The self-test changes the upper and lower disconnection values for each protective function on a linear basis for frequency monitoring and voltage monitoring. As soon as the measured value exceeds the permitted disconnection threshold, the inverter disconnects from the utility grid. In this way, the inverter determines the reaction time and checks itself.

After the self-test has been completed, the inverter automatically switches back to feed-in operation, resets the original disconnection conditions and connects to the utility grid. The test takes approximately three minutes.

Requirements:
- The country data set of the inverter must be set to **CEI 0-21 internal** or **DEWA 2016 internal**.

Procedure:

1. Select the menu **Device Configuration**.
2. Select [**Settings**].
3. Select [**Starting the Self-Test**] in the subsequent context menu.
4. Follow the instructions appearing in the dialog and save the report of the self-test where necessary.
8 Operation

8.1 Establishing a connection to the user interface

8.1.1 Establishing a Direct Connection via Ethernet

Requirements:
- The product must be commissioned.
- An end device (e.g. computer) with an Ethernet interface must be available.
- The product must be connected directly to the end device.
- The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
- The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

IP address of the inverter
- Standard inverter IP address for the direct connection via Ethernet: **169.254.12.3**

Procedure:
1. Open the web browser of your end device, enter the IP address **169.254.12.3** in the address bar and press the enter key.

2. Web browser signals a security vulnerability
   After the IP address has been entered, a message might appear indicating that the connection to the user interface of the product is not secure. SMA Solar Technology AG guarantees the security of the user interface.
   - Continue loading the user interface.

- The login page of the user interface opens.

8.1.2 Establishing a direct connection via WLAN

Requirements:
- The product must be commissioned.
- An end device (e.g. computer, tablet PC or smartphone) must be available.
- The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
- JavaScript must be enabled in the web browser of the end device.
- The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).
SSID, IP address and WLAN password

- SSID in WLAN: SMA[serial number] (e.g. SMA0123456789)
- Device-specific WLAN password: see WPA2-PSK on the type label of the product or the rear side of the manual included in delivery
- Standard access address for a direct connection via WLAN outside of a local network: http://smalogin.net or 192.168.12.3

Importing and exporting files with end devices having an iOS operating system is not possible.

For technical reasons, importing and exporting files (e.g., importing an inverter configuration, saving the current inverter configuration or exporting events and parameters) is not possible with mobile end devices having an iOS operating system.

- Use an end device that does not have an iOS operating system for importing and exporting files.

You have several options to connect the product to an end device. The procedure can be different depending on the end devices. If the procedures described do not apply to your end device, establish the direct connection via WLAN as described in the manual of your end device.

The following connection options are available:
- Connection to SMA 360° App
- Connection with WPS
- Connection with WLAN network search

Connection to SMA 360° App

Requirements:
☐ An end device with camera must be available.
☐ The SMA 360° App must be installed on the end device.
☐ An user account for Sunny Portal must already exist.

Procedure:
1. Open the SMA 360° App and login with your Sunny Portal account details.
2. Select Service > QR-Code Scan.
3. Scan the QR Code on your product via the SMA 360° App.
   ☑ The end device automatically connects to the inverter. The web browser of your end device opens and the login page of the user interface is displayed.
4. If the web browser of your end device does not open automatically and the login page of the user interface is not displayed, open the web browser and enter https://smalogin.net in the address bar.

Connection with WPS

Requirement:
☐ The end device must have a WPS function.
Procedure:
1. Enable the WPS function on the inverter. To do this, tap on the enclosure lid of the inverter twice.
   ☑ The blue LED flashes quickly for approx. two minutes. The WPS function is active during this time.
2. Enable the WPS function on your end device.
   ☑ The end device automatically connects to the inverter. The web browser of your end device opens and the login page of the user interface is displayed.
3. If the web browser of your end device does not open automatically and the login page of the user interface is not displayed, open the web browser and enter https://smalogin.net in the address bar.

Connection with WLAN network search
1. Search for WLAN networks with your end device.
2. Select the SSID of the inverter SMA[serial number] in the list with the found WLAN networks.
3. Enter the device-specific WLAN password (see WPA2-PSK on the type label of the product or the rear side of the manual included in delivery).
4. Open the web browser of your end device and enter https://smalogin.net in the address bar.
   ☑ The login page of the user interface is displayed.
5. If the login page of the user interface does not open, enter the IP address 192.168.12.3 or, if your end device supports mDNS services, SMA[serial number].local or http://SMA[serial number] in the address bar of the web browser.

8.1.3 Establishing a Connection via Ethernet in the local network

New IP address for connecting with a local network
If the product is connected to a local network (e.g. via a router), the product will receive a new IP address. Depending on the type of configuration, the new IP address will be assigned automatically by the DHCP server (router) or manually by you. Upon completion of the configuration, the product can only be reached via the following access addresses:
• Generally applicable access address: IP address manually assigned or assigned by the DHCP server (router) (identification via network scanner software or network configuration of the router).
• Access address for Apple and Linux systems: SMA[serial number].local (e.g. SMA0123456789.local)
• Access address for Windows and Android systems: http://SMA[serial number] (e.g., http://SMA0123456789)
Requirements:
☐ The product must be connected to the local network via a network cable (e.g. via a router).
☒ The product must be integrated into the local network. Tip: There are various methods of integrating the product into the local network with the aid of the installation assistant.
☐ An end device (e.g. computer, tablet PC or smartphone) must be available.
☒ The end device must be in the same local network as the product.
☐ The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
☐ The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

Procedure:
1. Open the web browser of your end device, enter the IP address of the inverter in the address bar of the web browser and press the enter key.

2. [i] Web browser signals a security vulnerability
   After the IP address has been entered, a message might appear indicating that the connection to the user interface of the product is not secure. SMA Solar Technology AG guarantees the security of the user interface.
   • Continue loading the user interface.
☒ The login page of the user interface opens.

8.1.4 Establishing a Connection via WLAN in the Local Network
[i] New IP address for connecting with a local network
   If the product is connected to a local network (e.g. via a router), the product will receive a new IP address. Depending on the type of configuration, the new IP address will be assigned automatically by the DHCP server (router) or manually by you. Upon completion of the configuration, the product can only be reached via the following access addresses:
   • Generally applicable access address: IP address manually assigned or assigned by the DHCP server (router) (identification via network scanner software or network configuration of the router).
   • Access address for Apple and Linux systems: SMA[serial number].local (e.g. SMA0123456789.local)
   • Access address for Windows and Android systems: http://SMA[serial number] (e.g., http://SMA0123456789)
Requirements:
☐ The product must be commissioned.
☐ The product must be integrated into the local network. Tip: There are various methods of integrating the product into the local network with the aid of the installation assistant.
☐ An end device (e.g. computer, tablet PC or smartphone) must be available.
☐ The end device must be in the same local network as the product.
☐ The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
☐ The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

ℹ️ Importing and exporting files with end devices having an iOS operating system is not possible.

For technical reasons, importing and exporting files (e.g., importing an inverter configuration, saving the current inverter configuration or exporting events and parameters) is not possible with mobile end devices having an iOS operating system.
- Use an end device that does not have an iOS operating system for importing and exporting files.

Procedure:
- Enter the IP address of the inverter in the address bar of the web browser.
  ☑️ The login page of the user interface opens.

8.2 Logging In and Out of the User Interface

After a connection to the user interface of the inverter has been established, the login page opens. Log onto the user interface as described below.

ℹ️ Usage of cookies

For the correct display of the user interface, cookies are required. The cookies are used for convenience only. By using this user interface you agree to the placement of cookies.

Log in as Installer or User for the First Time

ℹ️ Password assignment for user and installer

The passwords for the user groups Installer and User must be assigned when accessing the user interface for the first time. If the inverter was registered in a communication device (e.g., SMA Data Manager) and the system password was assigned, the system password is also the installer password. In this case, only the user password must be assigned.
- If you as a specialist assign the user password, only pass the password on to persons to access the inverter data via the user interface.
- If you as a user assign the installer password, only pass the password on to persons to receive access to the system.
Installer password for inverters registered in a communication device or in Sunny Portal

To be able to register the inverter in a communication device (e.g., SMA Data Manager) or in a Sunny Portal system, the password for the user group Installer must match the system password. If you assign a password for the user group Installer via the user interface of the inverter, the same password must also be used as the system password.

- Assign a uniform installer password to all SMA devices in the system.

Procedure:
1. In the drop-down list Language, select the desired language.
2. In the Password field, enter a password for the User user group.
3. In the Repeat password field, enter the password again.
4. Click on Save.
5. In the New password field, enter a password for the Installer user group. Assign a uniform password to all SMA devices to be registered in a system. The installer password is also the system password.
6. In the Repeat password field, enter the password again.
7. Click on Save and log in.
☑ The Configuring the Inverter page opens.

Log in as the User or Installer
1. In the drop-down list Language, select the desired language.
2. In the User group drop-down list, select the entry Installer or User.
3. Enter the password in the field Password.
4. Select Login.
☑ The start page of the user interface opens.

Log Out as the User or Installer
1. On the right-hand side of the menu bar, select the menu User Settings.
2. In the subsequent context menu, select [Logout].
☑ The login page of the user interface opens. The logout was successful.
8.3 Start Page Design of the User Interface

Figure 13: Design of the user interface's start page (example)
### Position | Designation | Description
--- | --- | ---
A | Menu | Provides the following functions:
  - **Home**
    - Opens the user interface homepage
  - **Instantaneous values**
    - Current measured values of the inverter
  - **Device Parameters**
    - The various operating parameters of the inverter can be viewed and configured here depending on the user group.
  - **Events**
    - All events that have occurred in the selected time period are displayed here. The event types are **Information**, **Warning** and **Error**. Currently existing events of the types **Error** and **Warning** will be additionally displayed in the **Device status** viewlet. However, only the higher-priority event is displayed. If, for example, there is a Warning and an Error present at the same time, only the Error will be displayed.
  - **Device configuration**
    - Various settings for the inverter can be made here. The selection available is dependent on which user group you are logged in as and the operating system of the device with which the user interface has been called up.
  - **Data**
    - You will find all data that is saved in the internal memory of the inverter or on an external storage medium on this page.

B | User settings | Provides the following functions, depending on the user group logged in:
  - Starting the installation assistant
  - SMA Grid Guard login
  - Logout

C | Help | Provides the following functions:
  - Displaying information on Open Source licenses used
  - Link to the website of SMA Solar Technology AG
## 8.4 Activating the Smart Inverter Screen

With the Smart Inverter Screen, the most important inverter data is displayed directly on the user interface login page. To activate the Smart Inverter Screen, proceed as listed in the following.
Procedure:
1. Activate the user interface (see Section 8.1, page 50).
2. Log in as Installer or User.
3. Select the menu User Settings (see Section 8.3, page 56) on the start page of the user interface.
4. Select [Smart Inverter Screen].
   ☑ The Smart Inverter Screen has been activated.

8.5 Starting the Installation Assistant

⚠️ QUALIFIED PERSON
The installation assistant leads you step-by-step through the steps necessary for the initial configuration of the inverter.

Layout of the installation assistant

Figure 14: Layout of the installation assistant (example)

<table>
<thead>
<tr>
<th>Position</th>
<th>Designation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Configuration steps</td>
<td>Overview of the installation assistant steps. The number of steps depends on the type of device and the additionally installed modules. The current step is highlighted in blue.</td>
</tr>
<tr>
<td>B</td>
<td>User information</td>
<td>Information about the current configuration step and the setting options of the configuration step.</td>
</tr>
<tr>
<td>C</td>
<td>Configuration field</td>
<td>You can make settings in this field.</td>
</tr>
</tbody>
</table>

Requirement:
☐ When configuring after completion of the first ten feed-in hours or after exiting the installation assistant, the SMA Grid Guard code must be available in order to change the grid-relevant parameters (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).
Procedure:
1. Open the user interface (see Section 8.1, page 50).
2. Log in as Installer.
3. Select the menu User Settings (see Section 8.3, page 56) on the start page of the user interface.
4. In the context menu, select [Starting the installation assistant].
☑ The installation assistant will open.

8.6 Activate WPS Function
The WPS function can be used for different purposes:
• Automatic connection to a network (e.g. via router)
• Direct connection between the product and an end device
Depending on the intended application of the WPS function, the procedure for activation will vary.

Activating WPS function for automatic connection to a network

Requirements:
☐ WLAN must be activated in the product.
☐ WPS must be activated on the router.

Procedure:
1. Activate the user interface (see Section 8.1, page 50).
2. Log in as Installer.
3. Start the installation assistant (see Section 8.5, page 59).
4. Select Network configuration.
5. Select WPS for WLAN network button in the WLAN tab.
6. Select Activate WPS.
7. Select Save and next and exit the installation assistant.
☑ The WPS function is activated and the automatic connection to the network can be established.

Activating the WPS function for direct connection to the end device.
• Activate the WPS function on the inverter. To do this, tap on the enclosure lid of the inverter twice.
☑ The blue LED flashes quickly for approx. two minutes. The WPS function is active during this time.

8.7 Switching WLAN On and Off
The inverter is equipped with an activated WLAN interface as standard. If you do not want to use WLAN, you can switch the WLAN function off and switch it on again whenever needed. In doing so, you can switch the WLAN direct connection and the WLAN connection in the local network on independently of each other.
Switching on the WLAN function only possible via Ethernet connection

If you switch off both the WLAN function for the direct connection and for the connection in the local network, access to the inverter user interface and therefore reactivation of the WLAN interface is only possible via an Ethernet connection.

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

Switching WLAN Off

If you would like to switch the WLAN function off completely, you must switch off both the direct connection and the connection in the local network.

Procedure:

- To switch off the direct connection in the parameter group PV system communication > WLAN, select the parameter Soft-access-point is turned on and set this to No.
- To switch off the connection in the local network in the parameter group PV system communication > WLAN, select the parameter WLAN is turned on and set this to No.

Switching WLAN On

If you have switched the WLAN function for direct connection or for connection in the local network off, you can switch the WLAN function back on in accordance with the following procedure.

Requirement:

☐ If the WLAN function was previously switched off completely, the inverter must be connected to a computer or router via Ethernet.

Procedure:

- To switch on the WLAN direct connection, in the parameter group PV system communication > WLAN, select the parameter Soft-access-point is turned on and set this to Yes.
- To switch on the WLAN connection in the local network, in the parameter group System communication > WLAN, select the parameter WLAN is turned on and set this to Yes.

8.8 Switching the Dynamic Power Display Off

As standard, the inverter signals its power dynamically via the pulsing of the green LED. When doing so, the LED flashes on and off uniformly or is permanently lit at full power. The various gradations are related here to the set active power limit of the inverter. If this display is not desired, switch this function off in accordance with the following procedure. Once this has been done, the green LED is lit permanently to signalize feed-in operation.

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

Procedure:

- In the parameter group Device > Operation, select the parameter Dynamic power display via green LED and set this to Off.
8.9 Changing the Password

The password for the inverter can be changed for both user groups. Furthermore, the user group Installer can change the password for the user group User as well as its own password.

**PV systems registered in a communication product**

With PV systems that are registered in a communication product (e.g. Sunny Portal, Sunny Home Manager), you can also assign a new password for the user group Installer via the communication product. The password for the user group Installer is also the system password. If you assign a password for the user group Installer via the user interface of the inverter that does not correspond to the system password in the communication product, the inverter can no longer be reached by the communication product.

- Ensure that the password for the user group Installer is the same as the system password in the communication product.

**Procedure:**

1. Activate the user interface (see Section 8.1, page 50).
2. Log into the user interface (see Section 8.2, page 54).
3. Call up the menu Device Parameters.
4. Select [Edit parameters].
5. In the parameter group User Rights > Access Control change the password of the desired user group.
6. Select [Save all] to save the changes.

8.10 Changing Operating Parameters

The operating parameters of the inverter are set to certain values by default. You can change the operating parameters to optimize the performance of the inverter.

This section describes the basic procedure for changing operating parameters. Always change operating parameters as described in this section. Some function-sensitive parameters can only be viewed by qualified persons and can only be changed by qualified persons by entering the personal SMA Grid Guard code.

**No configuration via Sunny Explorer**

Sunny Explorer does not support the configuration of inverters with their own user interface. The inverter can be detected via Sunny Explorer, however it is expressly not recommended to use Sunny Explorer to configure this inverter. SMA Solar Technology AG does not accept liability for missing or incorrect data and possibly resulting yield losses.

- Use the user interface for the configuration of the inverter.

**Requirements:**

☐ Changes to grid-relevant parameters must be approved by the responsible grid operator.

**Procedure:**

1. Open the user interface (see Section 8.1, page 50).
2. Log into the user interface (see Section 8.2, page 54).
3. Call up the menu **Device Parameters**.
4. Click on [**Edit parameters**].
5. Log in using the SMA Grid Guard code to change those parameters designated by a lock (only for installers):
   - Select the menu **User Settings** (see Section 8.3, page 56).
   - In the subsequent context menu, select [**SMA Grid Guard login**].
   - Enter the SMA Grid Guard code and select [**Login**].
6. Expand the parameter group that contains the parameter which is to be configured.
7. Change the desired parameters.
8. Select [**Save all**] to save the changes.

☑ The inverter parameters are set.

**Accepting the settings**

Saving the made settings is indicated by an hourglass symbol on the user interface. If the DC voltage is sufficient, the data is transferred directly to the inverter and accepted. If the DC voltage is too low (e.g. in the evening), the settings are saved, but they cannot be directly transferred to or accepted by the inverter. As long as the inverter has not yet received and accepted the settings, the hourglass symbol will continue to be displayed on the user interface. The settings will be accepted when there is sufficient DC voltage applied and the inverter restarts. As soon as the hourglass symbol appears on the user interface, the settings have been saved. The settings will not be lost. You can log off of the user interface and leave the system.

### 8.11 Configuring the Country Data Set

**QUALIFIED PERSON**

By default, the inverter is set to a universally valid country data set. You must adjust the country data set for the installation site.

**The country data set must be set correctly.**

If you select a country data set which is not valid for your country and purpose, it can cause a disturbance in the PV system and lead to problems with the grid operator. When selecting the country data set, you must always observe the locally applicable standards and directives as well as the properties of the PV system (e.g. PV system size, grid-connection point).

- If you are not sure which standards and directives are valid for your country or purpose, contact the grid operator.
Change to the names and units of grid parameters to comply with the grid-connection requirements in accordance with Regulation (EU) 2016/631 (valid from April 27, 2019)

To comply with the EU grid-connection requirements (valid from April 27, 2019) the names and units of grid parameters were changed. This change is valid from firmware version ≥ 3.00.00.R if a country data set for fulfilling the EU grid-connection requirements (valid from 2019-04-27) is set. Names and units of grid parameters for inverters with firmware version ≤ 2.99.99.R are not affected by this change and remain valid. This also applies from firmware version ≥ 3.00.00.R if a country data set that is valid for countries outside the EU is set.

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

Procedure:
- In the parameter group Grid monitoring > Grid monitoring select the parameter Set country standard and set the required country data set.

8.12 Configuring the Active Power Mode

Starting the installation assistant
1. Open the user interface (see Section 8.1, page 50).
2. Log in as Installer.
3. Start the installation assistant (see Section 8.5, page 59).
4. Select [Save and continue] after each step up until the step Grid management service.
5. Make the settings as described in the following.

Setting the connected line conductors
- In the tab Active power mode, select the line conductor to which the inverter is connected from the drop-down list Connected line conductors.

Make the settings for systems with external setpoint
1. Set the Grid connection point regulation to [Off].
2. In the tab Active power mode set the switch Active power setpoint to [On].
3. In the drop-down list Operating mode active power setpoint, select the entry External setpoint.
4. In the drop-down list Fallback behavior, select the entry Apply fallback values.
5. In the field Fallback value of the maximum active power enter the value to which the inverter is to limit its nominal power in case of a communication failure to the higher control unit at the end of the timeout time.
6. In the field **Timeout**, enter the time that the inverter is to wait before it limits its nominal power to the set fallback value.

7. If, in the event of a 0% or 0 W specification, the inverter is not permitted to feed small amounts of active power into the utility grid, select the entry **Yes** in the drop-down list **Grid disconnection for 0% active power setpoint**. This ensures that in the event of a 0% or 0 W specification, the inverter disconnects from the utility grid and does not feed in active power.

**Make the settings for systems with manual setpoint**

1. In the tab **Active power mode** set the switch **Grid connection point regulation** to [On].
2. Enter the total PV array power in the field **Nominal PV system power**.
3. In the drop-down list **Operating mode active power setting**, select whether active power limitation is to be performed via a fixed specification in percent or in watts.
4. In the field **Set active power limit**, enter the value to which the active power at the grid-connection point is to be limited. The value must be set to 0 for zero power output.
5. Set the **Active power setpoint** to [On].
6. Select the entry **Manual setpoint in %** or **Manual setpoint in W** for manual specification and enter the respective setpoint value.
7. If the inverter itself is to control active power at the grid-connection point, perform the following steps:
   - In the drop-down list **Operating mode active power setting**, select the entry **External setting**.
   - In the drop-down list **Fallback behavior**, select the entry **Apply fallback values**.
   - In the drop-down list **Grid disconnection for 0% active power setting** select the entry **No**.

### 8.13 Configuring the Modbus Function

⚠️ **QUALIFIED PERSON**

The Modbus interface is deactivated by default and the communication ports 502 set.

In order to access SMA inverters with SMA Modbus® or SunSpec® Modbus®, the Modbus interface must be activated. After activating the interface, the communication ports of both IP protocols can be changed. For information on commissioning and configuration of the Modbus interface, see the technical information "SMA and SunSpec Modbus® Interface" at www.SMA-Solar.com.

For information on which Modbus registers are supported, see the technical information "Modbus® parameters and measured values" at www.SMA-Solar.com.
Data security during enabled Modbus interface

If you enable the Modbus interface, there is a risk that unauthorized users may access and manipulate the data or devices in your PV system.

To ensure data security, take appropriate protective measures such as:

- Set up a firewall.
- Close unnecessary network ports.
- Only enable remote access via VPN tunnel.
- Do not set up port forwarding at the communication port in use.
- In order to disable the Modbus interface, reset the inverter to the default settings or disable the parameter again.

Procedure:

- Activate the Modbus interface and adjust the communication ports if necessary (see the technical information "SMA and SunSpec Modbus® Interface" at www.SMA-Solar.com).

8.14 Activating the Receipt of Control Signals (Only for Italy)

QUALIFIED PERSON

In order for PV systems in Italy to receive control commands from the grid operator, set the following parameters.

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value/range</th>
<th>Resolution</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application ID</td>
<td>0 to 16384</td>
<td>1</td>
<td>16384</td>
</tr>
<tr>
<td>GOOSE-Mac address</td>
<td>01:0C:CD:01:00:00 to 01:0C:CD:01:02:00</td>
<td>1</td>
<td>01:0C:CD:01:00:00</td>
</tr>
</tbody>
</table>

Procedure:

1. Select the parameter group External communication > IEC 61850 configuration.
2. In the field Application ID, enter the application ID of the grid operator gateway. You will receive this value from your grid operator. You can enter a value between 0 and 16384. The value 16384 indicates "deactivated".
3. In the field GOOSE-Mac address, enter the MAC address of the grid operator gateway from which the inverter is to receive the control commands. You will receive this value from your grid operator.

☑ The receipt of control signals from the grid operator is activated.
8.15 Deactivating Grounding Conductor Monitoring

⚠️ QUALIFIED PERSON

If the inverter is to be installed in an IT network or another grid configuration in which deactivation of the grounding conductor monitoring is required, deactivate the grounding conductor monitoring as follows.

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

Procedure:

- In the parameter group Grid monitoring > Grid monitoring > Country standard set the parameter PE connection monitoring to Off.

8.16 Setting SMA ShadeFix

⚠️ QUALIFIED PERSON

You can set the time interval in which the inverter has to determine the optimum operating point. If you do not want to use SMA ShadeFix, you can disable the feature.

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

Procedure:

- In the parameter group DC-side > DC settings > SMA ShadeFix, set the parameter Time interval of SMA ShadeFix and set the required time interval. The ideal time interval is usually six minutes. This value should only be increased if the shading situation changes extremely slowly.
  - ☑ The inverter optimizes the MPP of the PV system at the predetermined time interval.
- In order to disable the SMA ShadeFix feature, in the parameter group DC-side > DC settings > SMA ShadeFix, set the parameter SMA ShadeFix switched on to Off.

8.17 Setting the Rated Residual Current of the Residual-Current Device

⚠️ QUALIFIED PERSON

When using residual-current devices with a rated residual current of 30 mA, set the rated residual current to 30 mA. In this way the inverter reduces the operational leakage currents and prevents a false triggering of the residual-current device (for further information, see technical information "Leading Leakage Currents" at www.SMA-Solar.com).

The basic procedure for changing operating parameters is explained in another section (see Section 8.10 "Changing Operating Parameters", page 62).

Procedure:

- Select the parameter RCD adjustment and set it to 30 mA.
8.18 Saving the Configuration in a File

You can save the current configuration of the inverter in a file. You can use this file as a data backup for this inverter and then import this file into this inverter again or another inverter from the same type or device family to configure the inverter. When saving, only the device parameters will be saved, not any passwords.

Procedure:
1. Activate the user interface (see Section 8.1, page 50).
2. Log into the user interface (see Section 8.2, page 54).
3. Select the menu Device Configuration.
4. Select [Settings].
5. In the context menu, select [Saving the configuration in a file].
6. Follow the instructions in the dialog.

8.19 Adopting a Configuration from a File

⚠️ QUALIFIED PERSON

To configure the inverter, you can adopt the configuration from a file. To be able to do this, you must first save the configuration of another inverter from the same type or device family in a file (see Section 8.18 "Saving the Configuration in a File", page 68). When saving, only the device parameters will be adopted, not any passwords.

Requirements:
- ☐ Changes to grid-relevant parameters must be approved by the responsible grid operator.
- ☐ The SMA Grid Guard code must be available (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

Procedure:
1. Open the user interface (see Section 8.1, page 50).
2. Log into the user interface as an Installer (see Section 8.2, page 54).
3. Select the menu Device Configuration.
4. Select [Settings].
5. In the context menu, select [Adopting the configuration from a file].
6. Follow the instructions in the dialog.

8.20 Updating the Firmware

⚠️ QUALIFIED PERSON

If no automatic update is set in the communication product (e.g. SMA Data Manager or Sunny Home Manager) or in Sunny Portal, you have the option of carrying out a manual firmware update.

You have the following options to update the firmware:
- Update the firmware with the existing update file via the user interface of the inverter.
• Search and install the firmware via the user interface of the inverter.

Update the firmware with the existing update file via the user interface of the inverter.

Requirements:
☐ An update file with the desired inverter firmware must be available. The update file is, for example, available for download on the product page of the inverter at www.SMA-Solar.com. To download the update file, it is necessary to enter the serial number of the inverter.

Procedure:
1. Open the user interface (see Section 8.1, page 50).
2. Log into the user interface as an Installer (see Section 8.2, page 54).
3. Select the menu Device Configuration.
4. In the inverter row, click on the gear icon and select Update firmware.
5. Select [Browse] and select the update file for the inverter.
6. Select Update firmware.
7. Follow the instructions in the dialog.

Search and install the firmware via the user interface of the inverter.

Requirements:
☐ The inverter must be connected to the Internet.

Procedure:
1. Open the user interface (see Section 8.1, page 50).
2. Log into the user interface as an Installer (see Section 8.2, page 54).
3. Click on [Edit parameters].
4. Go to Device > Update.
5. Select the parameter Check for update and install it and set it to Execute.
6. Click on [Save all].
☑ The firmware is updated in the background.
Prior to performing any work on the inverter, always disconnect it from all voltage sources as described in this section. Always adhere to the prescribed sequence.

**WARNING**

Danger to life due to electric shock from destruction of the measuring device due to overvoltage

Overvoltage can damage a measuring device and result in voltage being present in the enclosure of the measuring device. Touching the live enclosure of the measuring device results in death or lethal injuries due to electric shock.
- Only use measuring devices with a DC input voltage range of 600 V or higher.

**Procedure:**

1. Disconnect the AC circuit breaker and secure it against reconnection.
2. Set the DC load-break switch of the inverter to O.
3. Wait until the LEDs have gone out.
4. Use a current clamp to ensure that no current is present in the DC cables.
5. **DANGER**

**Danger to life due to electric shock when touching exposed DC conductors or DC plug contacts if the DC connectors are damaged or loose**

The DC connectors can break or become damaged, become free of the DC cables, or no longer be connected correctly if the DC connectors are released and disconnected incorrectly. This can result in the DC conductors or DC plug contacts being exposed. Touching live DC conductors or DC plug connectors will result in death or serious injury due to electric shock.

- Wear insulated gloves and use insulated tools when working on the DC connectors.
- Ensure that the DC connectors are in perfect condition and that none of the DC conductors or DC plug contacts are exposed.
- Carefully release and remove the DC connectors as described in the following.

6. Release and remove the DC connectors. To do so, insert a flat-blade screwdriver or an angled screwdriver (blade width: 3.5 mm) into one of the side slots and pull the DC connectors out. When doing so, do not lever the DC connectors out, but insert the tool into one of the side slots only to release the locking mechanism, and do not pull on the cable.

7. Ensure that no voltage is present between the positive terminal and negative terminal at the DC inputs using a suitable measuring device.

8. Ensure that no voltage is present between the positive terminal and ground as well as between the negative terminal and ground on the DC inputs using a suitable measuring device.
9. Unscrew the AC connector and pull it out of the jack for the AC connection.
10 Cleaning the Inverter

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Damage due to cleaning agents</td>
</tr>
<tr>
<td>The use of cleaning agents may cause damage to the product and its components.</td>
</tr>
<tr>
<td>• Clean the product and all its components only with a cloth moistened with clear water.</td>
</tr>
<tr>
<td>• Ensure that the inverter is free of dust, foliage and other dirt.</td>
</tr>
</tbody>
</table>
11 Troubleshooting

11.1 Forgotten Password

If you have forgotten the password for the inverter, you can unlock the inverter with a Personal Unlocking Key (PUK). For each inverter, there is one PUK for each user group (User and Installer).

Tipp: With PV systems that are registered in a communication product, you can also assign a new password for the user group Installer via the communication product. The password for the user group Installer is the same as the system password in the communication product.

Procedure:
2. Open the user interface (see Section 8.1, page 50).
3. Enter the PUK instead of the password into the field Password.
4. Select Login.
5. Call up the menu Device Parameters.
6. Click on [Edit parameters].
7. In the parameter group User Rights > Access Control change the password of the desired user group.
8. Select [Save all] to save the changes.

Password assignment for inverters that are registered in a communication product

The password for the user group Installer is also the system password for the system in the communication product. Changing the password of the user group Installer can lead to the inverter no longer being able to be reached by the communication product.

- In the communication product, assign the changed password of the user group Installer as the new system password (see the manual of the communication product).
## 11.2 Event Messages

<table>

</tr>
</tbody>
</table>
| 301          | **Grid fault**  
The ten-minute average value of the grid voltage is no longer within the permissible range. The grid voltage or grid impedance at the connection point is too high. The inverter disconnects from the utility grid to maintain power quality.  
**Corrective measures:**  
• During the feed-in operation, check whether the grid voltage at the connection point of the inverter is permanently in the permissible range. If the grid voltage is outside the permissible range due to local grid conditions, contact the grid operator. The grid operator must agree with an adjustment of the voltage at the feed-in point or with a change of the monitored operating limits.  
If the grid voltage is permanently within the permissible range and this message is still displayed, contact Service. |
| 302          | **Active power limited AC voltage**  
The inverter has reduced its power due to a too-high grid voltage to ensure grid stability.  
**Corrective measures:**  
• If possible, check the grid voltage and observe how often fluctuations occur. If fluctuations occur frequently and this message is displayed often, contact the grid operator and request approval to change the operating parameters of the inverter. If the grid operator gives his approval, discuss any changes to the operating parameters with the Service. |
| 401 404      | **Grid fault**  
The inverter has disconnected from the utility grid. A stand-alone grid or a very large change in the power frequency was detected.  
**Corrective measures:**  
• Check the grid connection for significant short-term frequency fluctuations. |

| 7320         | **The device with serial number [xx] was successfully updated to firmware version [xxx].**  
The firmware update was completed successfully. |
| 7330         | **Condition test failed**  
The testing of the update conditions was successful. The firmware update package is suitable for this inverter. |
| 7331         | **Update transport started**  
Update file is being copied. |
| 7332         | **Update transport successful**  
Update file was copied successfully to the inverter's internal memory. |
| 7333         | **⚠️ QUALIFIED PERSON**  
**Update transport failed**  
Update file could not be copied to the inverter's internal memory. In the event of connection with the inverter via WLAN, a poor connection quality can be the cause.  
**Corrective measures:**  
• Retry update.  
• For WLAN connection: Improve the WLAN connection quality (e.g. via WLAN repeater) or establish connection with the inverter via Ethernet.  
• If this message is displayed again, contact the Service. |
| 7341         | **Update Bootloader**  
The inverter is performing a bootloader update. |
| 7342         | **⚠️ QUALIFIED PERSON**  
**Update Bootloader failed**  
The bootloader update failed.  
**Corrective measures:**  
• Retry update.  
• If this message is displayed again, contact the Service. |
| 7347         | **⚠️ QUALIFIED PERSON**  
**Incompatible file**  
The configuration file is not suitable for this inverter.  
**Corrective measures:**  
• Ensure that the selected configuration file is suitable for this inverter.  
• Retry import. |

### 11.3 Checking the PV System for Ground Faults

⚠️ **QUALIFIED PERSON**

A ground fault may be present if the inverter beeps, the red LED lights up and the event numbers 3501, 3601 or 3701 are being displayed in the **Results** menu on the inverter user interface. The electrical insulation from the PV system to ground is defective or insufficient.

⚠️ **DANGER**

**Danger to life due to electric shock when touching live system components in case of a ground fault**

If a ground fault occurs, parts of the system may still be live. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Touch the cables of the PV array on the insulation only.
- Do not touch any parts of the substructure or frame of the PV array.
- Do not connect PV strings with ground faults to the inverter.
## WARNING

**Danger to life due to electric shock from destruction of the measuring device due to overvoltage**

Overvoltage can damage a measuring device and result in voltage being present in the enclosure of the measuring device. Touching the live enclosure of the measuring device results in death or lethal injuries due to electric shock.

- Only use measuring devices with a DC input voltage range of 600 V or higher.

### Procedure:

In order to check the PV system for ground faults, perform the following actions in the prescribed order. The exact procedure is described in the following sections.

- Check the PV system for ground faults by measuring the voltage.
- If the voltage measurement was not successful, check the PV system via insulation resistance measurement for ground faults.

### Test by Measuring the Voltage

Proceed as follows to check each string in the PV system for ground faults.

### Procedure:

1. **DANGER**

   **Danger to life due to high voltages**
   - Disconnect the inverter from all voltage sources (see Section 9, page 70).

2. Measure the voltages:
   - Measure the voltage between the positive terminal and the ground potential (PE).
   - Measure the voltage between the negative terminal and the ground potential (PE).
   - Measure the voltage between the positive and negative terminals.

   If the following results are present at the same time, there is a ground fault in the PV system:
   - All measured voltages are stable.
   - The sum of the two voltages to ground potential is approximately equal to the voltage between the positive and negative terminals.

3. If a ground fault is present, determine the location of the ground fault via the ratio of the two measured voltages and eliminate the ground fault.

4. If a definite ground fault cannot be measured and the message is still displayed, measure the insulation resistance.

5. Reconnect the strings without ground faults to the inverter and recommission the inverter (see inverter installation inverter).
Location of the ground fault

The example shows a ground fault between the second and third PV module.

\[ V_1 = 200 \text{ V} \quad V_2 = 300 \text{ V} \]

Test by Measuring the Insulation Resistance

If the voltage measurement does not provide sufficient evidence of a ground fault, the insulation resistance measurement can provide more exact results.

Figure 15: Schematic diagram of the measurement
Calculating the insulation resistance

The expected total resistance of the PV system or of an individual string can be calculated using the following formula:

\[ \frac{1}{R_{\text{total}}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \ldots \]

The exact insulation resistance of a PV module can be obtained from the module manufacturer or the datasheet.

For the resistance of a PV module an average value can be assumed: for thin-film PV modules approximately 40 MOhm and for polycrystalline and monocrystalline PV modules approximately 50 MOhm per PV module (for further information on calculating the insulation resistance see the Technical Information "Insulation Resistance (Riso) of Non-Galvanically Isolated PV Systems" at www.SMA-Solar.com).

Required devices:
- Suitable device for safe disconnection and short-circuiting
- Measuring device for insulation resistance

Device required for safe disconnection and short-circuiting of the PV array

The insulation resistance can only be measured with a suitable device for safe disconnection and short-circuiting of the PV array. If no suitable device is available, the insulation measurement must not be carried out.

Procedure:

1. Calculate the expected insulation resistance per string.
2. Danger to life due to high voltages
   - Disconnect the inverter from all voltage sources (see Section 9, page 70).
3. Install the short circuit device.
4. Connect the measuring device for insulation resistance.
5. Short-circuit the first string.
6. Set the test voltage. The test voltage should be as close as possible to the maximum system voltage of the PV modules but must not exceed it (see datasheet of the PV modules).
7. Measure the insulation resistance.
8. Eliminate the short circuit.
9. Measure the remaining strings in the same manner.
   - If the insulation resistance of a string deviates considerably from the theoretically calculated value, there is a ground fault present in that string.
10. Reconnect to the inverter only those strings from which the ground fault has been eliminated.
11. Reconnect all other strings to the inverter.
12. Recommission the inverter.

13. If the inverter still displays an insulation error, contact the Service (see Section 14, page 107). The PV modules might not be suitable for the inverter in the present quantity.

11.4 Problems with streaming services

If you use the streaming service in your local network (in which the inverter is also included), there may be interference to the transfer of data. In this case, the IGMP settings of the inverter can be changed via operating parameters.

- Contact the Service and change IGMP settings in consultation with the Service department.
12 Decommissioning the Inverter

⚠️ QUALIFIED PERSON

To decommission the inverter completely upon completion of its service life, proceed as described in this Section.

⚠️ CAUTION

Risk of injury due to weight of product
Injuries may result if the product is lifted incorrectly or dropped while being transported or mounted.
- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.

Procedure:

1. ⚠️ DANGER

Danger to life due to high voltages
- Disconnect the inverter from all voltage sources (see Section 9, page 70).

2. ⚠️ CAUTION

Risk of burns due to hot enclosure parts
- Wait 30 minutes for the enclosure to cool down.

3. Unscrew the RS485 plug and pull it out of the jack.

4. Screw the protective cap onto the RS485 jack.

5. Unscrew the swivel nut from the threaded sleeve for the network cable.
6. Unscrew and remove the threaded sleeve from the network port thread on the inverter.

7. Release the network cable plug and pull it out of the jack on the inverter.

8. Take the cable support sleeve out of the threaded sleeve and remove the network cable from the cable support sleeve.

9. Lead the network cable out of the threaded sleeve and the swivel nut.

10. Screw the protective cap onto the network port.

11. Unscrew and remove the antenna.
12. If there is a protective cap available, plug the protective cap onto the jack for connecting the antenna.

13. If an additional grounding or an equipotential bonding is connected to the inverter, unscrew the pan head screw M5x12 (TX25) and remove the grounding cable.

14. Unscrew the left- and right-hand pan head screws M5x12 used to secure the inverter to the wall mounting bracket (TX25).

15. Remove the inverter by lifting it vertically up and off the wall mounting bracket.

16. Unscrew the screws for fastening the wall mounting bracket and remove the wall mounting bracket.

17. If the inverter is to be stored or shipped, pack the inverter, the AC connector, the DC connector, the RJ45 protective sleeve, the antenna and the wall mounting bracket. Use the original packaging or packaging that is suitable for the weight and dimensions of the inverter.

18. Dispose of the inverter in accordance with the locally applicable disposal regulations for electronic waste.

## 14 Contact

If you have technical problems with our products, please contact the SMA Service Line. The following data is required in order to provide you with the necessary assistance:

- Device type
- Serial number
- Firmware version
- Event message
- Mounting location and mounting height
- Type and number of PV modules
- Optional equipment, e.g. communication products
- Use the name of the system in Sunny Portal (if available)
- Access data for Sunny Portal (if available)
- Special country-specific settings (if available)
